Background: According to lab automation manufacturers, their solutions improve standardization, decrease time to obtain results (TTR) and reduce lab worforces. A WASPLab[™] solution was introduced in the 24/7 Lyon Hospitals lab early November 2017 ensuring automatization of approximatively 88% of the samples in September 2018. To assess the medical value of lab automation solution at this stage, TTR of urine, blood cultures (BC) and multi drug resistant organism screenings (MDRO) were compared before and after automation.

Materials/methods: Based on laboratory information system data (GLIMS, MIPS), the time between streaking final sample to confirmation by lab technicians (LT): "final confirmation" and validation by medical microbiologists: TTR "final validation" were measured on three types of samples: urine, MDRO and BC. Data from matched periods of 2017 without automation 2018 with WASPLab™ versus (Copan/bioMérieux) were compared the other instruments whilst remained unchanged. Whereas the LT number and MDRO workflow was unaffected between 2017 and 2018, the implementation of WASPLab™ allowed a new lab organization with an extended D1 lab technicians activities from 8am-4pm to 8am-8pm for urine and BC samples. For positive MDRO, off line tests (Etest, MIC) were added in 2018. For BC, an additional visual reading of pictures after 8h of incubation was also introduced.

Conclusions: These preliminary results reveal that automation improve standardization of incubation/reading steps. Without workflow change, the TTR of MDRO was slightly lengthened (due to increase of positive rate and addition of off line tests). In contrast, the association of WASPLab[™], extension of reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC and 8pm by LT, and for BC an additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and for BC additional reading time to 8pm by LT, and 8pm by L

To assess the medical value of WASPLab[™] lab automation solution, TTR of urine, blood cultures (BC) and multi drug resistant organism screenings (MDRO) were compared before and after automation.
